

Social Network Analytics Platform

Scenario and objectives

A content-sharing platform dedicated to culture and gastronomy generates heterogeneous data, such as user posts, social interactions (likes, comments, follows), and real-time activity streams.

The project addresses building a polyglot system to manage variety, supporting social graph analysis, content virality tracking, and personalised feed generation.

Example data sources

- [Tweets](#). It contains 1,600,000 tweets extracted using the twitter api. The tweets have been annotated and they can be used to detect sentiment
- [Social Media Usage](#). Insights into the usage patterns of social media apps for 1,000 users across seven popular platforms
- [Social Media Engagement](#). Machine-generated dataset simulating social media engagement data across various metrics
- [Yelp](#). Massive dataset with real-world data related to businesses including reviews, photos, check-ins

General-purpose resources for project proposals

General purpose resources

The following resources can be explored to include and integrate additional information which could be useful for the final solution

Geodata:

- [OpenStreetMap](#) (geo-map data)
- [Leaflet](#) (interactive maps)

Open data sources:

- [aperTO](#) (open data about Turin services)
- [Open Data Piemonte](#) (Piedmont region open data)
- [Dati.Milano](#) (Milan city open data)

... or feel free to find other sources you consider a better fit for your project!
